

IMPORTANT - READ FIRST HOT KNIFE CUTTING GUIDELINES

For best results, follow these guidelines:

1. Allow the hot knife to pre-heat before cutting.
2. Begin cutting as soon as the blade is hot enough to cut fibers.
3. Do not let the blade become overheated. It may “smear” the fibers instead of cutting them. If this occurs, recut the fiberhead.
4. Use the following diagram as an example of the correct cutting position of the blade. Note the bevel orientation.
5. Do not use a sawing motion. Apply a steady, constant and straight pressure on the fibers, letting the heat cut the fibers.
